

Ciba has evaluated the estimated non-occupational exposure to benoxacor and based on its low use rate concludes that the potential for non-occupational exposure to the general population is unlikely except for the potential residues in food crops discussed above. Benoxacor is used only on agricultural crops and is not used in or around the home.

#### 4. Cumulative Effects

Ciba also considered the potential for cumulative effects of benoxacor and other substances that have a common mechanism of toxicity. Ciba concluded that consideration of a common mechanism of toxicity is not appropriate at this time. Ciba does not have any reliable information to indicate that toxic effects seen at high doses of benoxacor (generalized liver toxicity, nephrotoxicity and the occurrence of forestomach tumors in an organ not present in humans) would be cumulative with those of any other chemical compounds; thus Ciba is considering only the potential risks of benoxacor in its aggregate exposure assessment.

#### 5. Safety Determination

##### A. U.S. Population

Using the conservative exposure assumptions described above and based on the completeness and reliability of the toxicity data base for benoxacor, Ciba has calculated that aggregate exposure to benoxacor will utilize 9.4% of the RfD for the U.S. population based on chronic toxicity endpoints and only 0.4% based on a margin of exposure assessment and a carcinogenic NOEL of 4.2 mg/kg/day. EPA generally has no concern for exposures below 100 percent of the RfD because the RfD represents the level at or below which daily aggregate dietary exposure over a lifetime will not pose appreciable risks to human health. Ciba concludes that there is a reasonable certainty that no harm will result from aggregate exposure to benoxacor residues.

##### B. Infants and Children

Using the same conservative exposure assumptions used for the determination

in the general population, Ciba has concluded that the percent of the RfD that will be utilized by aggregate exposure to residues of benoxacor is 10.5% for nursing infants less than 1 year old, 40.4% for non-nursing infants, 23.8% for children 1–6 years old and 15.4% for children 7–12 years old. These worst case estimates are likely at least 4 times greater than actual values when considering that benoxacor residues have not been detected at the limit of quantitation of 0.005 ppm (tolerance is 0.01 ppm) and using a more realistic market share of 50% rather than the conservative 100%. Therefore, based on the completeness and reliability of the toxicity data base and the conservative exposure assessment, Ciba concludes that there is a reasonable certainty that no harm will result to infants and children from aggregate exposure to benoxacor residues.

#### 6. International Tolerances

A maximum residue level has not been established for benoxacor by the Codex Alimentarius Commission.
