### Food Safety and Inspection Service

[Docket No. 98-035N]

#### Salmonella Enteritidis Risk Assessment: Shell Eggs and Egg Products; Availability of Document

**AGENCY:** Food Safety and Inspection Service, USDA.

**ACTION:** Notice.

**SUMMARY:** In December 1996, the Food Safety and Inspection Service (FSIS) began a comprehensive risk assessment of *Salmonella enterica* serotype Enteritidis (*Salmonella* Enteritidis (SE)) in response to an increasing number of human illnesses associated with the consumption of shell eggs and egg products. The final report on risk assessment is now available on the FSIS website and in the FSIS Docket Room. This document summarizes the risk assessment process from the development of a conceptual framework through the incorporation of available data into a comprehensive quantitative model, which characterizes the public health effects associated with the consumption of SE-infected shell eggs and egg products.

**ADDRESSES:** The document is available electronically on the FSIS website at <http://www.fsis.usda.gov/ophs/risk/index.htm>. Hard copies of the executive summary are available in the FSIS Docket Room, Room 102, Cotton Annex Building, 300 12th Street, SW, Washington, DC 20250-3700.

**FOR FURTHER INFORMATION CONTACT:** Dr. Ruth A. Etzel, Director, Epidemiology and Risk Assessment Division, Office of Public Health and Science, by telephone at (202) 501-7472 or by FAX at (202) 501-6982.

**SUPPLEMENTARY INFORMATION:** The risk assessment model consists of five modules. The Egg Production Module estimates the number of eggs produced that are infected (or internally contaminated) with SE. The Shell Module, the Egg Products Module, and

the Preparation and Consumption Module estimate the increase or decrease in the numbers of SE organisms in eggs or egg products during storage, transportation, processing, and preparation. The Public Health Module then calculates the incidences of illness and four clinical outcomes (recovery without treatment, recovery after treatment by a physician, hospitalization, and mortality) and cases of reactive arthritis associated with consuming SE positive eggs.

The baseline model for shell eggs presented in the executive summary simulates an average production of 46.8 billion shell eggs per year, 2.3 million of them contaminated with SE. The model predicts that consumption of these eggs would result in a mean of 661,633 cases of human illnesses per year within a range of 126,374 to 1.7 million cases annually. It is estimated that about 94 percent of these cases recover without medical care, 5 percent consult a physician, 0.5 percent are hospitalized, and 0.05 percent of the cases result in death.

The risk assessment model can be continually refined and updated for use in future risk assessments for shell eggs and egg products. FSIS plans to use the risk assessment data to conduct cost-effectiveness studies and cost-benefit analyses.

Done, at Washington, DC, on July 5, 1998.
