### I. Information Collection Request

NAGB is seeking comments on the following Information Collection Request (ICR).

*Title:* An Investigation of Alternative Methods for Scale Anchoring and Item Mapping in the National Assessment of Educational Progress.

*Affected Entities:* Parties affected by this information collection are persons who served as panelists for pilot studies, achievement levels-setting (ALS) meetings, and validation research for the 1998 Science NAEP.

*Abstract.* The purpose of this information collection activity is to gather research information for NAGB to be used in evaluating the procedures for the selection of exemplar items to represent student performance on NAEP. Exemplar items are used as one of the primary means of communicating student performance on NAEP. The criteria for selecting exemplar items is critical to the "message" portrayed by the items when reporting the outcomes of NAEP to the public.

Two statistical criteria currently guide the selection of exemplar items: One based on item difficulty, and the other on item discrimination. Part One of the study will examine that statistical criteria used to select exemplar items by comparing various scale anchoring and item mapping methodologies. The results of these systematic comparisons will be judged not only statistically, but also according to the degree to which they agree with informed judgments about item difficulty. Collecting responses from informed judges is Part Two of the study. Because these individuals have participated in the process of setting achievement levels for the 1998 Science NAEP, they are likely to be keenly interested in the research study.

In Part One of the study, several technical aspects of the anchoring process will be investigated:

- (1) Stringency of difficulty criterion (response probability criterion);
- (2) Point versus interval-based estimates;
- (3) Empirical versus model-based estimates;
- (4) Type of discrimination criterion.

Before conducting the data analysis of the anchoring process, cross validation analyses of random half-samples of the data will be done. Four methods of analyzing the student data are planned:

- (1) Empirical/interval estimation;
- (2) Empirical/point estimation;
- (3) Model-based/interval estimation;
- (4) Model-based/point estimation.

Three factors will be considered as the criteria to determine which anchoring/mapping method is best:

- (1) Consistency of results across subsamples;
- (2) The degree to which the results are supported by informed judgment;
