k. *Description of Project:* The proposed Gulf Stream Ocean Current Electricity Project would anchor a cluster of Electricity Production Units (EPU) more than three miles offshore, in a 1,000-square-mile area off the Florida coast between Miami and Palm Beach. Each EPU is approximately 240 feet long, with two counter-rotating fiberglass blades, and will incorporate buoyancy and anchoring systems, electrical generators, and transmission cables. The units would be anchored to the sea floor at a depth of more than 200 feet, eight per mile, and would generate approximately three megawatts of electricity, using the Gulf Stream current. The units would be connected to on-shore monitoring stations via undersea transmission cables. These on-shore stations will monitor pressure, temperature, vibration, RPM, and power output, and would be connected to an interstate power grid. The initial project would be located more than three miles offshore of the City of Riviera Beach, with a transmission line connecting to a land station on Singers Island. This land station would be connected to an interstate grid.

When a Declaration of Intention is filed with the Federal Energy Regulatory Commission, the Federal Power Act requires the Commission to investigate and determine if the interests of interstate or foreign commerce would be affected by the project. The Commission also determines whether or not the project: (1) Would be located on a navigable waterway; (2) would occupy or affect public lands or reservations of the United States; (3) would utilize surplus water or water power from a government dam; or (4) if applicable, has involved or would involve any construction subsequent to 1935 that

may have increased or would increase the project's head or generating capacity, or have otherwise significantly modified the project's pre-1935 design or operation.
