

underlies the Tularosa Basin. The water within the aquifer and within the Basin is saline and would require treatment to meet drinking water standards. Saline water is defined as water that has a total dissolved solids (salts) concentration that is above drinking water standards. Estimates indicate that the volume of saline water stored within the Basin is enough to sustain a regional water supply to meet the region's present and future demands, if treated to meet drinking water standards. The Project is proposed to help serve the water supply needs of the Alamogordo region by continuing to ensure water conservation within the City, and by treating saline water from the Basin to meet drinking water standards.

Parameters to be evaluated in the EIS include (1) the location of project facilities, (2) desalination methodologies, (3) the effects of pumping water from the Hueco-Bolson aquifer, (4) the techniques used for concentrate disposal or beneficial re-use of concentrate that is a product of the desalination process, and (5) the consequences of not developing the Project.
