Proposed Project

Measuring Preferences for Quality of Life for Child Maltreatment—New—National Center for Injury Prevention and Control (NCIPC), Division of Violence Prevention (DVP), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

The CDC requests approval of a study and subsequent survey fielding to measure the quality-of-life (QoL) impacts resulting from child maltreatment (CM) using a quantitative, preference-based approach. The U.S. Department of Health and Human Services, among many others, has identified child maltreatment as a serious U.S. public health problem with substantial long-term physical and psychological consequences. Despite considerable research on the consequences of CM in adult survivors, few studies have utilized standard QoL techniques and none have quantified childhood QoL impacts. This gap in the literature means the full QoL burden of CM has not been measured inhibiting the evaluation and comparison of CM intervention programs. This study will improve public health knowledge and economic evaluation of the QoL impacts of physical and sexual CM, including

effects specific to juvenile and adolescent survivors, through the development and fielding of a preference-based survey instrument.

CDC has contracted with RTI International to develop and field a survey instrument to measure the QoL impacts of child maltreatment. RTI will develop the instrument based on standardized QoL methods, existing instruments, a literature review of CM outcomes, and qualitative research techniques. The final instrument will be fielded to a national sample and data analyzed to measure the impacts of CM. Survey development will include interviews with both clinician proxies for adolescent survivors and CM survivors, as well as focus groups with same-sex adult CM survivors.

The instrument will be pretested to an online national sample of all U.S. adults. After pretesting, the final survey will be fielded to a nationally-representative sample of 2000 U.S. adults. The survey will focus on QoL measures of preferences and contain limited questions on past CM exposure to identify possible CM survivors. The national sample will be representative of the U.S. population and include a significant number of CM survivors so that preferences can be estimated separately based on past CM exposure.

Final results will provide an estimate of the quality-of-life burden of child maltreatment in the United States. Analysis and results of the survey data will be used to inform the public health community of the impact of CM, and to evaluate and compare CM intervention programs.

There are no costs to respondents other than their time.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of respondent	Form	No. of respondents	No. of responses per respondent	Average burden per response (in hours)	Total burden (in hours)
