SUPPLEMENTARY INFORMATION:

Background: The NIOSH Manual of Analytical Methods (NMAM) was first published in 1974 and currently contains over 300 methods that can be used by occupational safety and health professionals to measure worker exposures to chemical and biological agents. In addition to the methods, the NMAM contains chapters that offer guidance on workplace air sampling, instrumentation, analytical protocols, and quality assurance. The draft chapter entitled, “Analysis of Carbon Nanotubes and Nanofibers on Mixed Cellulose Ester Filters by Transmission Electron Microscopy,” is proposed for addition to NMAM and provides standardized approaches for the analysis of carbon nanoparticles. These standardized approaches are meant to harmonize analytical techniques, enabling comparison of results between studies and fostering optimal data quality. NIOSH scientists published studies on the microanalysis of airborne carbonaceous nanomaterials, and this research has led to the procedures described in this chapter. The chapter provides detailed guidance on effective means to perform transmission electron microscopic analysis on carbon nanotubes and nanofibers that are sampled from occupational atmospheres. This draft chapter has previously undergone scientific peer review and is proposed for inclusion in the 5th edition of NMAM (www.cdc.gov/niosh/nmam).

Information Needs: NIOSH is seeking public review and comment on this document from anyone with an interest in analysis of carbon nanoparticles.

John Howard,

Director, National Institute for Occupational Safety and Health, Centers for Disease Control and Prevention.
