

burnup data by cycle is used to calculate discharged fuel characteristics and obtain fundamental parameters needed for spent fuel safety analyses.

- Section C.1.4 is added to the survey to collect data on all discharged fuel that is shipped or transferred to other storage sites (since January 1, 2003). This information was last collected in the 2003 using Form RW-859 and allows the tracking of all spent nuclear fuel discharged by commercial reactors, regardless of current ownership or transit status.

- Section C.2 'Projected Assembly Discharges' is deleted since this data is no longer needed for analysis.

- Section C.3.3.1 requests information for consolidated, reconstituted, reconstructed fuel assemblies. A drop-down menu was created with these three choices of fuel assemblies.

- A note is added in Section D.3.2 'Multi-Assembly Canisters/Casks Inventory' to capture deviations from standard operating procedures related to drying, backfilling, leak testing, or pad transfer processes.

- Dry cask loading pattern maps with orientation details are added to Section D.3.3 of the survey. For each canister/cask model, respondents provide or reference a loading map that clearly indicates identifiers for basket cell locations relative to fixed drain and vent port locations. For systems stored horizontally, the map indicates which direction is up when placed in a horizontal storage module. The dry cask loading pattern data facilitates detailed as-loaded analyses and enables the quantification of realistic safety margins and conditions.

- Section E.2 'Non-fuel Components Integral to an Assembly' is deleted and the data on non-fuel components integral to an assembly should be reported in Section C.1.1.

- Schedule G is deleted. This schedule was used to collect comments. It is easier for respondents to provide comments when completing a schedule so the new form will collect comments after each section.

- A copy of Standard Contract (10 CFR 961.11) Appendix E *General Specifications* is added to the survey for the convenience of the respondents.

- The following terms have either been added or updated to match the definition prescribed by the Standard Contract; Canister, DOE Facility, Failed Fuel, Multi-Assembly Canister/Cask, Non-fuel Component Identifier, Non-standard Fuel and Reconstructed Assembly.

- DOE proposes to use Form GC-859 to collect information once every three years. Reporting once every three years

reduces respondent burden by permitting all new data for the multiyear period to be reported in one report.

(5) *Annual Estimated Number of Respondents*: 125 respondents with one response each.

(6) *Annual Estimated Number of Total Responses*: The annual number of total responses is 42.

(7) *Annual Estimated Number of Burden Hours*: 3,746.7 hours.

(8) *Annual Estimated Reporting and Recordkeeping Cost Burden*: Additional costs to respondents are not anticipated beyond costs associated with response burden hours. The information is maintained in the normal course of business. The cost of the burden hours is estimated to be \$275,980 (3,746.7 burden hours times \$73.66 per hour). EIA estimates that there are no additional costs to respondents associated with the survey other than the costs associated with the burden hours.
